

V — Options Strategy Report

Visa Inc. · Financial Services / Credit Cards · Generated July 25, 2026

Current price	\$355.62
52-week range	\$252.84 – \$365.14
Market cap	\$680.00B
1-month return	7.1%
3-month return	5.3%
YTD return	3.5%
Direction (auto)	BULLISH (bias score +1.00)

Technical outlook

SMA(20)	\$352.90
SMA(50)	\$336.44
SMA(200)	\$338.43
RSI(14)	57.6
Direction signal	BULLISH (bias score +1.00)

Volatility profile

30-day historical vol (HV30)	22.7%
90-day historical vol (HV90)	20.1%
HV30 percentile (1y)	96th
ATM call IV	39.4%
ATM put IV	37.8%
ATM IV (avg)	38.6%
IV – HV30	15.9%
IV regime	HIGH (IV – HV30 = +15.9 pts)

Reading this: when implied vol is meaningfully above realized vol, options are expensive — that favors strategies that *collect* premium (cash-secured puts, covered calls, iron condors). When IV is at or below HV, options are relatively cheap and directional *premium-buying* strategies (long calls/puts, debit spreads) are more attractive.

Recommended strategies

Based on a **BULLISH** directional bias and a **HIGH** implied-volatility regime, the following 3 simple strategies fit best for an expiration around **2026-07-31**. Each shows specific contracts, max profit/loss, breakeven price(s), and a payoff diagram at expiration.

1. Cash-Secured Put

Sell an out-of-the-money put while holding enough cash to buy the stock if assigned. You collect premium up front. Best when you'd be happy owning the stock at the strike price and IV is elevated.

✓ **You win when:** Stock stays above the strike at expiration. You keep the full premium as profit. Even if the stock dips slightly, as long as it stays above the strike you win.

✗ **You lose when:** Stock falls below the breakeven (strike – premium) and you are assigned — you buy 100 shares at the strike price (above market). Loss = (strike – market price – premium received) × 100. The max loss shown assumes the stock goes to \$0, which is extremely unlikely. Your effective cost basis is reduced by the premium collected.

Suggested contract(s)

Action	Type	Strike	Expiration	Mid price	Cost / share
SHORT	PUT	\$347.50	2026-07-31	\$3.66	\$-3.66

Risk & reward (1 contract bundle = 100 shares per leg)

Net credit per contract	\$365.50
Max profit (1 contract)	\$365.50
Max loss (1 contract)	\$34,384.40 (if stock → \$0)
Breakeven(s) at expiration	\$343.84
Approx. probability of profit	74.9%
Capital at risk (cash reserved)	\$34,750.00

Days to expiration: 6 · IV used for POP estimate: 38.6%

2. Covered Call

Sell an out-of-the-money call (strike \$350.00) against 100 shares of stock you already own (at \$355.62). Generates income from premium. Caps your upside at the strike, but you keep all dividends and downside is the same as holding the stock minus the premium received. Best in flat-to-slightly-bullish setups with elevated IV.

✓ **You win when:** Stock stays below the strike at expiration. You keep the premium and your shares. Total return = premium + any stock appreciation up to the strike.

✗ **You lose when:** Stock drops — you lose on the shares (partially offset by the premium received). Worst case: stock goes to \$0, max loss = purchase price – premium received. If stock rallies well above the strike, your shares are called away, capping upside but still giving a profit = (strike – purchase price) + premium.

Suggested contract(s)

Action	Type	Strike	Expiration	Mid price	Cost / share
LONG	STOCK	\$355.62	2026-07-31	\$355.62	+\$355.62
SHORT	CALL	\$350.00	2026-07-31	\$10.15	-\$10.15

Risk & reward (1 contract bundle = 100 shares per leg)

Net debit per contract	\$34,547.00
Max profit (1 contract)	\$453.00
Max loss (1 contract)	\$34,546.90 (if stock → \$0)
Breakeven(s) at expiration	\$345.47
Approx. probability of profit	71.7%
Capital at risk (cash reserved)	\$34,546.90

Days to expiration: 6 · IV used for POP estimate: 38.6%

3. Long Call

Buy an at-the-money call. Profits if the stock rallies meaningfully before expiration. Loss capped at the premium paid. Best when implied vol is reasonable and you expect a directional move.

✓ **You win when:** Stock rises above the breakeven (strike + premium paid). Profit grows dollar-for-dollar with the stock price above the strike, minus the cost of the call.

✗ **You lose when:** Stock stays at or below the strike at expiration. You lose the entire premium paid (max loss). A partial move above the strike but below breakeven results in a partial loss.

Suggested contract(s)

Action	Type	Strike	Expiration	Mid price	Cost / share
LONG	CALL	\$350.00	2026-07-31	\$10.15	\$+10.15

Risk & reward (1 contract bundle = 100 shares per leg)

Net debit per contract	\$1,015.00
Max profit (1 contract)	Unlimited
Max loss (1 contract)	\$1,015.00
Breakeven(s) at expiration	\$360.15
Approx. probability of profit	39.5%
Capital at risk (cash reserved)	\$1,015.00

Days to expiration: 6 · IV used for POP estimate: 38.6%
